BEFORE

AFTER

H2O DC is a very effective, low cost dust control additive.

H2O DC works by causing a bond between loose clay particles making them less likely to become airborne. Erosion induced by wind is also greatly reduced.

Application:

H2O DC is mixed with water and applied by a water truck centrifugal pump sprayer to high dust surfaces.

This non-toxic product requires agitation and should be added to the water truck reservoir when being filled with water. Best results are realized when a proper water to H2O DC ratio is achieved for various environmental conditions.

General Dosage Guidelines:

- Initial dosage of 20lbs per 5000 gallons of water.
- Second application reapply same dosage.
- Maintenance dosage of 10lbs per 5000 gallons dilution.

Performance:

H2O DC should be reapplied when dust rising becomes noticable. Soil structure will change over time with continued use. Reapplication will only be necessary with reappearance of dust.

Measurement:

20L pail
